1. (Previously Presented) A method for launching remote test execution

requests in a distributed test framework, comprising:

using a first agent process having an agent launcher interface to launch a first test

execution request having a call interface, wherein the call interface provides a reference

to the first agent process such that the first test execution request and the first agent

process communicate with each other during execution of the first test execution request;

sending a launch request from the first test execution request to the agent launcher

interface of the first agent process using the reference to the first agent process as

provided by the call interface of the first test execution request, wherein the launch

request specifies a second test execution request to be launched, and wherein the launch

request defines required attributes of an unidentified computer system necessary to

execute the second test execution request thereon;

operating the agent launcher interface to send a request to a system controller

requesting identification of a computer system having the required attributes necessary to

execute the second test execution request;

operating the system controller to identify the computer system having the

required attributes necessary to execute the second test execution request; and

launching the second test execution request on the identified computer system

having the attributes defined in the launch request,

wherein each of the first and second test execution requests includes commands specifically programmed to initiate a number of functional aspects of a software product to be tested.

- 2. (Previously Presented) A method as recited in claim 1, wherein the second test execution request is launched by a second agent process executing on the identified computer system.
- 3. (Previously Presented) A method as recited in claim 2, wherein the second agent process is registered with a look up service, the registering being configured to advertise the attributes of the identified computer system to the system controller via the look up service.
 - 4. (Cancelled)

15

- 5. (Previously Presented) A method as recited in claim 3, wherein the system controller is configured to search the look up service to locate a computer system having attributes substantially matching the attributes defined in the launch request.
- 6. (Previously Presented) A method as recited in claim 5, wherein the second test execution request includes a second call interface, and the second call interface includes a parameters hash table that provides initialization values for the second test execution request.

7. (Previously Presented) A method as recited in claim 6, wherein the agent

launcher interface of the first agent process further includes parameters that provide

initialization values for the second test execution request.

5 8. (Previously Presented) A method as recited in claim 7, wherein the

initialization values provided by the parameters of the agent launcher interface of the first

agent process can be passed to the second call interface via the parameters hash table of

the second call interface of the second test execution request.

9. (Previously Presented) A system for launching remote test execution

requests in a distributed test framework, comprising:

a first agent process executing on a first computer system, wherein the first agent

process includes an agent launcher interface; and

a first test execution request having a call interface that provides a reference to the

first agent process such that the first test execution request and the first agent process

communicate with each other during execution of the first test execution request, wherein

the first test execution request is capable of sending a launch request to the agent launcher

interface of the first agent process using the reference to the first agent process, the launch

request specifying a second test execution request to be launched and defining required

attributes of a second computer system upon which the second test execution request is to

be executed without specifically identifying the second computer system,

wherein each of the first and second test execution requests includes commands

specifically programmed to initiate a number of functional aspects of a software product

to be tested.

10-12. (Cancelled)

13. (Previously Presented) A system as recited in claim 9, further comprising:

a system controller in communication with the first agent process, the system

controller defined to receive a computer system identification request from the agent

launcher interface of the first agent process, the system controller further defined to

search a look up service to identify a computer system having the required attributes

defined in the launch request.

14. (Cancelled)

15. (Previously Presented) A system as recited in claim 13, wherein the second

test execution request includes a second call interface, and the second call interface

further includes a parameters hash table that provides initialization values for the second

test execution request.

16. (Previously Presented) A system as recited in claim 15, wherein the agent

launcher interface of the first agent process further includes parameters that provide

initialization values for the second test execution request, wherein the initialization values

can be passed to the second call interface via the parameters hash table of the second call

interface.

17. (Currently Amended) A computer <u>readable medium encoded with program</u>

instructions embodied on a computer-readable medium for launching remote test

execution requests in a distributed test framework, comprising:

a code segment that receives a reference to a first agent process, wherein the reference can be utilized to access the first agent process during execution;

a code segment that receives initialization parameters for a first test execution request, wherein the initialization parameters can be used to set initial values for specific parameters of the first test execution request; and

a code segment that calls an agent launcher interface of the agent process using the reference, wherein a request to launch a second test execution request is sent to the agent launcher interface, and wherein required attributes of an unidentified computer system necessary to execute the second test execution request are passed to the agent launcher process,

wherein each of the first and second test execution requests includes commands specifically programmed to initiate a number of functional aspects of a software product to be tested.

- 18. (Currently Amended) A computer <u>readable medium program</u> as recited in claim 17, wherein the required attributes are utilized to select a computer system having substantially matching attributes to execute the second test execution request.
- 19. (Currently Amended) A computer <u>readable medium</u> program as recited in claim 18, wherein the selected computer system is selected from a list of computer systems advertised on a look up service.
 - 20. (Currently Amended) A computer <u>readable medium program</u> as recited in claim 19, wherein the selected computer system includes a second agent process, and wherein the second agent process launches the second test execution request.

21. (Previously Presented) A method as recited in claim 1, wherein the

unidentified computer system is unidentified to the first test execution request at the time

the launch request is sent from the first test execution request to the agent launcher

interface of the first agent process.

22. (Currently Amended) A computer readable medium program as recited in

claim 17, wherein the unidentified computer system is unidentified to the code segment

that calls the agent launcher interface of the agent process using the reference at the time

the request to launch the second test execution request is sent to the agent launcher

interface.
